Monday, March 15, 2010
Agenda

1. Technology for Leak Screening and Quantification of Fugitive Methane Emissions
2. Natural Gas Distribution Experience
3. Natural Gas Transmission Experience
Reducing Emissions, Increasing Efficiency, Maximizing Profits
How Does the RMLD Measure Gas?

Example:
- Scan Distance: 15 m (50 ft)
- IR Beam 'Footprint': 4.9 m (16 ft) x .3 m (11 inches) @ 15 m (50 ft)
- Background Methane: 1 ppm
- Avg. Plume Concentration: 20 ppm
- Plume Width (Distance IR beam passes through plume): 2 m
- RMLD reading: Background + leak = (15 m x 1 ppm) + (2m x 20ppm) = 55 ppm-m

Reducing Emissions, Increasing Efficiency, Maximizing Profits
Reducing Emissions, Increasing Efficiency, Maximizing Profits

Pump Driven CGI

Ultrasonic
Measurement / Quantification of Hydrocarbon Emissions

- For leaks up to 10 cfm – Hi Flow Sampler
  10.5 cfm @ $5/Mcf = $27,594
  **Hi Flow Sampler Cost = $18,800**

- For leaks 10 – 240 cfm – Vent-Bag Method
  50 cfm @ $5/Mcf = $131,400
  100 cfm @ $5/Mcf = $262,800
  **Calibrated Vent Bag Cost = $90**

- For leaks >180 cfm – Anamometer
  - Used only on vertical open ended line
  - Much more subjective, requires experience.
Hi Flow Sampler

Applications

Advantages:
- Total Leak Capture
- Measures Leak Rate Directly
- Accuracy of Calculated Leak Rate = +/- 5% of reading
- Can Measure 30 components per hour
- Repair Decision Based on Leak Rate & Repair Costs
Hi Flow Sampler Technology

• Captures Entire Leak
  – Measures Flow Rate (F) and Concentration (sample)
  – Subtracts the background (back) Concentration
  – Leak Rate = F x (sample – back)
Calibrated 3 Cubic Foot Measurement Bag

Description:

The largest emissions observed at compressor stations are typically from open ended lines (2" to 12" I.D.) that are used as vents for blow down valves, unit valves, scrubber dump valves, pressure relief valves and rod packing systems. Some of the largest leaks from these vents occur when compressors are blown down and the blow down valve is open, allowing leaks across the suction and discharge block valves to vent through the blow down line. For scrubber dump valves, large leakage can occur after valve actuation when dirt and debris get caught in the valve seat allowing high pressure gas to leak through the unclosed valve to the condensate tank and then vent to open atmosphere. Unchecked compressor rod packing systems can leak substantial amounts of gas when running or idle because of several contributing factors which typically go unnoticed. It is under these conditions, we have measured leaks as large as 240 scfm of natural gas. To make measurements on leaks of this magnitude, we have fabricated calibrated bags of anti-static plastic of various sizes with a special neck to fit over vent openings. This allows a low-pressure drop measurement of vented systems that may not tolerate significant backpressure. The use of these “Vent-Bags” has been calibrated in our laboratory against rotameter measurements and been found accurate to within ±10%. Given proper training while observing strict safety guidelines, this technique for measuring large natural gas leaks can be safe, expedient and affordable.

Leak Detection and Repair at Metering and Regulator Stations

- Systematic leak detection and repair at metering and regulator stations must be approached differently than at compressor stations and processing plants
  - Lower pressures, smaller leaks
  - Fewer components per site
- Some US companies elect to conduct leak screening only
  - Forego leak measurement to reduce survey costs
  - Fix all leaks that are identified
  - Survey is low cost but does not collect data on leak rates and gas savings
    - This information is needed to determine which leaks are cost-effective to repair
JI/CDM Industry Experience: Distribution Companies in Russia and CIS Countries

• Leak Reduction from Natural Gas Distribution Regulator Stations using AM0023.
Common Emission Sources at Distribution Metering and Regulator Stations

- Study of Former Soviet Union metering and regulator stations revealed common leaking components
  - Relatively small component counts per station

Valve Stem Packing Replacement

- Replacing valve stem packing is a common leak repair activity at distribution gate stations and surface facilities
- GORE-TEX valve stem packing is one option for replacement
  - Polytetraflouroethylene material (no asbestos)
  - Chemical resistant, pH 0 - 14
  - -268°C to 315°C
Valve Stem Packing Replacement: Oblgas System Experience (Russian)

- Oblgas Join Implementation (JI) Project
  - Methane Emissions Avoidance in the Tula Gas Distribution Network
- Project Description
  - All valves screened and inspected for leaks
  - Replace all (leaking and non-leaking) valve stem packing with GORE-TEX packing
  - Use GORE-TEX packing for all new valve installations
Valve Stem Packing Replacement: Oblgaz System Experience (Russian)

- **Project results**
  - A system can have 10,000 - 75,000 valves
  - Leaking valves in region averaged 6 LPM or 3,000 M3/year or approximately 42 Tonnes CO2E/Year.
  - Expected Project Reductions for Valves only = 420,000 – 3,000,000 in Annual Emission Reduction Units.
3 Main Categories of Leaks

• Standardized Components
  – Flange, Union, Thread & Tube Fittings, valve caps, fuel injector valves, stem packing leaks etc…

• Compressor Seal Systems
  – Rod Packing Vent or Combined Distance Piece and Packing Vent, Wet or Dry Seal Vents on Turbines

• Blow Down Systems
  – Unit Valves, Blow Down Valves, Pressure Relief Valves, Power Gas Vent, Condensate Tanks, ESD Vents
Top 4 Typical Fugitive Sources

- Reciprocating Compressor Packing
- Blow Down Valves
- Unit Valves
- Scrubber Dump Valves

Reducing Emissions, Increasing Efficiency, Maximizing Profits
About Rod Packing Leakage

• Under best conditions leak rate can be expected at a minimum of 11.5 scfh
• Leakage can be reduced through proper monitoring and a cost effective schedule for replacing packing rings & piston rods.
• Step one is to monitor and record baseline packing leakage and piston rod wear.
• Establish a replacement threshold
Rod Packing Leak Rates at Oklahoma Compressor Station

1 Year Payback Threshold at 55 scfh
Equivalent to $2409/yr

Gas = $5/Mcf

• Step one is to monitor and record baseline packing leakage and piston rod wear.
• Establish a replacement threshold
Routine Monitoring of known culprits and plan for future DI&M

Reducing Emissions, Increasing Efficiency, Maximizing Profits
Annual Station Monitoring Program

• Inspect significant leaks identified from recent survey and verify repairs remain intact.

• Inspect all critical components for new leakage
  – Compressor Packings
  – Unit Valves, Blowdown Valves, Dump Valves

• Spot check yard for leaks
